Modular Design of Processing and Storage Facilities for Small Volumes of Low and Intermediate Level Radioactive Waste including Disused Sealed Sources

David R. Keene*, Susanta Kumar Samanta** and Zoran Drace**

* Nuvia Limited, UK
** Waste Technology Section, International Atomic Energy Agency, Vienna, Austria
Background (1)

• A number of IAEA Member States generate relatively small quantities of radioactive waste and/or disused sealed sources.
• Many of these Member States do not have facilities for processing and storing their radioactive wastes - notably in those countries with small quantities of generated radioactive wastes.
• In other Member States the existing waste processing and storage facilities (WPSF) are in need of varying degrees of upgrading.
• IAEA supports these Member States to manage their radioactive wastes in a safe and cost-effective manner.
• Wide variation in the needs of these Member States because of the wide variation in the types and quantities of radioactive waste.
• Therefore the IAEA has developed a modular design approach for a Waste Processing and Storage Facility (WPSF)
• WPSF based on a variety of modules for different waste stream treatment and conditioning processes as well as for storage.
• Each module can be constructed locally or pre-fabricated and delivered as skids then combined with other modules to meet the country specific needs.
• Similarly for storage, different storage module concepts are available ranging from simple storage cabinets up to a purpose designed storage building.
• Modular WPSF design is elaborated in a substantial Design Engineering Package
Design Engineering Package Content

- Overview of the technical and regulatory requirements for setting up WPSF.
- A description of typical wastes generated in these Member States.
- Identification of the preferred processing and storage options.
- Waste management decision flowcharts.
- Design and specification information for each of the process or storage modules.
- Guidance on the integration of the modules to provide a complete waste management capability.
- Operating guidelines for a modular WPSF.
Design Engineering Package

Modular Design of Processing Facilities
Design Engineering Package Content:
Waste Processing

- Waste types and quantities
- Waste processing technologies
- Waste management decision flowcharts
- Waste processing modules - design and specification information
- Example procurement specifications
## Waste Types and Quantities (1)

### Cross-Ref. Waste Stream

- **A**: Low Volume Aqueous Liquid
- **B**: High Volume Aqueous Liquid
- **C**: Organic Liquid
- **D**: Compactable Solid
- **E**: Non-Compactable Solid
- **F**: Ion Exchange Resins
- **G**: Sludge
- **H**: Disused Sealed Source - Short Lived Isotope (half-life ≤30 y)
- **J**: Disused Sealed Source - Long Lived Isotope (half-life > 30 y)
- **K**: Biological (Carcasses)
- **L**: High Activity Disused Sealed Source

### Solid Waste Technologies

- **Chemical Treatment**: Various stages indicated by B1 to B6
- **Ion Exchange**: B1 to B6
- **Reverse Osmosis**: B1 to B6
- **Cross-flow Filtration**: B4 to B6
- **Filtration**: B4 to B6
- **Solidification**: A6
- **Encapsulation**: E1
- **Low Force Compaction**: E1
- **Unshielded Booth**: D3
- **Mobile Hot Cell**: F1
## Waste Processing Technologies (2)

Waste Management Decision Flowcharts

- Radioactive Waste Management Strategy
- Radioactive Waste Categorisation
- Solid Waste Management
- Low Volume Liquid Waste Management
- High Volume Liquid Waste Management
- Organic Liquid Waste Management
Waste Management Decision Flowcharts: e.g. High Volume Liquid Waste Management
Design and specification information (1)

- General Module Specification Sheet
  - Functional requirements
  - Summary description
  - Estimate of costs
  - Support requirements – services, storage, staff, equipment

- Interface Specification Sheet
  - Equipment details - sizes, weights
  - Service requirements – electricity, water
Design and specification information (2)

- Module Specifications
  - General
  - Basis of Design
  - Process Flow Diagram
  - Equipment lists
  - Equipment description
  - Process Description and Operation
Example Module Specification Information:  
*Chemical Treatment - Module B1*

Treatment of high volume aqueous waste

- Treat aqueous waste in batches.
- Produce a small volume of sludge containing the radionuclides.
- Bulk volume of the aqueous waste either discharge immediately, or further "polishing" before discharge.
Example Module Specification Information:

**Chemical Treatment - Module B1**
Example Module Specification Information:

Chemical Treatment - Module B1
Example Module Specification Information:

*Chemical Treatment - Module B1*

UN Group I certified container for liquid waste

Other examples of processing modules

- Filtration
- Ion exchange
- Cross flow filtration
- Reverse Osmosis
- Solidification
- Unshielded booth
Integration can involve physical co-location and sequential operation of the process modules with the benefits of:

- Minimising double-handling of waste and hence reduced dose uptake by the operators.
- More efficient and effective use of staff and resources as wastes can be processed in short campaigns.
- Reduced interim storage of un-conditioned or incompletely treated waste because waste streams are processed from their raw form to final conditioned form in one campaign.
Examples of module integration (1)

- Chemical treatment
- Filtration
- Ion exchange
- Solid waste sorting
- Encapsulation
Examples of module integration (2)

- Chemical treatment
- Cross-flow filtration
- Ion exchange
- Solidification of sludge and IX media
The aim of the specification is to provide a clear definition of:

- The scope of work required
- The technical requirements
- How the work must be done
- How the contractor must demonstrate that he has met the technical requirements
- Any information the contractor needs to do the work
Design Engineering Package

Modular Design of Storage Facilities
Design Engineering Package Content:

Storage

- Waste types and quantities
- Storage options
- Storage decision flowcharts
- Storage design and specification information
Waste Package Characteristics

- 200-litre / 45-55 gallon waste drums
- Drum weight could vary:
  - 50 kg (in-drum compacted soft waste)
  - up to 400 kg for encapsulated and solidified wastes
- Low radiation dose rates to allow contact handling
- Drums are free of external contamination
Waste Package Quantities

- Number of packages could vary from 1 or 2 drums per year up approximately 30-40 drums produced each year.
- Plus Member States may have quantities of historical or legacy waste to be conditioned, packaged and stored.
- Number of packages and the rate at which they are received will determine the storage facility size and need for expansion.
Store Design Options

Wide variety of storage concepts are available:

- Shielded cabinet
- Concrete container
- Dedicated room
- Transport container
- Below ground tubes or vaults
- Purpose built industrial building
- Existing building
Store Design Options: **Shielded Cabinet**

- Ideal for storage of small waste packages in small quantities
- Can be located within an existing facility
- Can be locked to provide security
Store Design Options: *Concrete container*

- Widely used as transport, storage and disposal containers.
- Particularly suitable for higher dose rate waste packages as the box provides shielding.
- Most, if not all designs have a removable lid for loading waste packages.
- Requires a crane and grab for handling waste packages and removal of the lid.
- Adds complexity and cost to drum handling.
Store Design Options: ISO freight container

- Widely available throughout the world
- Container Safety Convention certification.
- In wind and water tight condition.
- Fitted with a steel floor (or steel cladding of the existing wooden floor, sealed to the walls) to provide a decontaminable surface.
- Finished with a good paint finish outside and inside.
- Fitted with lock boxes on the doors to improve security.
Store Design Options: *Dedicated room*

- Room in an existing facility may be suitable if waste volumes are relatively small.
- Need to consider:
  - Access into the room carrying drums with fork lift truck or pallet trucks will require a double door (normal personnel single doors not wide enough).
  - Access route to the room from where the waste drums (flat, smooth, width)
Store Design Options: *Concrete bunkers or trenches*

- Particularly suited to high dose rate wastes
- Construction challenge involving excavation and reinforced concrete retaining walls as well as consideration of access and drainage.
- Loading the bunker or trench with drums from above requires crane or grab.
Store Design Options: *Purpose built industrial building*
Storage Decision Flowcharts (1)

- Storage Strategy
- Assessment of Existing Facilities for Storage
- Implementation of a New Storage Facility
- Store Specification and Design
- Store Design Requirements
Summary

The Design Engineering Package enables users:
- to select the optimum waste processing and storage modules to meet their needs, and
- to specify the requirements for procurement of individual modules and their integration into a waste processing and storage facility.
Design Engineering Package is planned for publication by the IAEA in 2012 and presented as:

- A Design Engineering Package Summary document.
- A supporting CD that contains:
  - Process module general specifications.
  - Process module interface specifications.
  - Design Engineering Package for process modules.
  - Sample technical specifications for design and construction of modular processing facility.
  - Design Engineering Package for storage modules.
Thank you for your attention!
